

ValidateThis! 0.65 - Runs on Railo!

Related Categories: ColdFusion, Railo, ValidateThis

Thanks to some prompting from a guy named Charlie I took some time this weekend to attempt to get ValidateThis!, my framework for ColdFusion objects, running on [Railo](#).

Installing and configuring Railo to run on my Windows machine with Apache was a bitch, but after some help from [Mark Mandel](#) I had it up and running. A few hours of debugging later, with the help of [MXUnit](#), of course, and with a bit more help from Mr. Mandel, the framework was tested and working on Railo.

I must say that I really like Railo. The administrator is nice - I had no problems setting up mappings and datasources to mimic my CF install. And it seems to run markedly faster than CF, on my machine anyway.

I plan to write some posts on the challenges that I encountered, both with the installation and with the code base, in the near future.

As always, the code is available to download from [RIAForge](#), and if you have any questions or interest in following the progress of VT, I invite you to join the [ValidateThis! Google Group](#)
