

## Snow Leopard Eclipse Settings Gotcha

I just upgraded my MBP to Snow Leopard and I found that Eclipse would no longer start on my machine. It turns out that I had some custom settings in my eclipse.ini file, that I had picked up from a [blog post](#) by [Marc Esher](#). Those settings did help speed up Eclipse, but one of them also prevented it from starting after the 10.6 upgrade.

I removed the offending option, `-XX:+UseParallelOldGC`, from my eclipse.ini file and now Eclipse is up and running again!
